With this tool, you can easily convert MS Access databases to MySQL format and use them in development or testing environments. The application comes with a wizard-like interface and allows you to specify which MS Access database you want to use as a data source for the transfer, then specify the destination folder. If your Access database is password protected, you can also enter your security settings and get maximum protection. The second step enables you to specify the MySQL destination database and connection information. However, the destination is mainly a MySQL server or a dump file. Depending on the destination type you choose, you need to specify some important details to make the conversion process much easier. For instance, if you choose MySQL as a destination database, you need to specify the connection settings for the server. Considering that the user credentials are valid and the connection works, you can easily select the tables you want to transfer from MS Access to a new MySQL server. The main window of the application displays all the available tables found in the selected file. Additionally, you can choose whether to transfer indexes or records, or simply recreate the destination database then easily view the generated results. Because of the main purpose it was designed for, MS Access To MySQL Crack Keygen manages to convert data from MS Access and transfers it to MySQL in a convenient way so it can be readable by a MySQL server. What's more, MS Access To MySQL comes with support for both shared and user-level secure files, so no matter the level of protection that each file comes with, you can easily convert it and transfer all the contained data to a MySQL server. Because it was designed as a versatile solution, the utility comes with a command line interface as well. Advanced users can use this feature if they want to run simple commands and perform complex actions within seconds. Using MS Access To MySQL you have the possibility to convert MS Access databases and transfer all the tables and password protected databases you want to a MySQL server effortlessly.
